Delegated Authorization Management

B2B Access Control for third party risk mitigation and supply chain security

Protect Your B2B Attack Surface

Enterprises rely heavily on external parties to drive revenue and business processes, such as data collaboration, distribution, reselling, brokering, and more. Nevertheless, the absence of robust security measures among vendors, suppliers, contractors, or business partners can leave these industries vulnerable to third-party data breaches.

Traditional approaches such as IGA and IAM solutions can be configured to address basic requirements for B2B access, however they fall short in satisfying modern business and security requirements, and fail to address the full digital journey across applications, API gateways, microservices and data.

Delegated Authorization Management

Delegated Authorization Management, provided by the PlainID Authorization Platform, enables you to centrally manage partners and other third parties. Administrative capabilities are delegated to partners via self-service management of access, while simultaneously aligned with your enterprise security framework.

In addition, PlainID assists organizations in continuously verifying trust during each digital interaction across the technology stack by making it easy to create, manage and enforce access control policies for B2B access.

Business Values

IMPROVED SECURITY THROUGH VISIBILITY AND CONTROL
Tailor access controls for downstream administrators and and safeguard data access for third party identities who rely on B2B and B2C engagement.

SIMPLIFY AUDITING AND COMPLIANCE
Comply with nuanced data sharing requirements around privacy and PII. PlainID provides ease of central management and visibility across lines of business.

REDUCE COSTS THROUGH AUTOMATION
Minimize the amount of time to onboard new organizations and empower partner productivity with automated role assignment.
